Pivot bug fix	14
Bug fix: Decimals disappears after pivot	14
Updated version of jQuery-UI	14
New default encoder	14

What is new in PxWeb 2020 v1?

This document is a description of the features and bug fixes that are introduced with PxWeb 2020 v1.

PxWeb User interface

Responsive user interface

The user interface now works better on mobile phones.

All responsive-related styling are located in a new stylesheet Responsive.css.

Improved search on the selection page

Values matching the search criteria are displayed at the top of the selection list.

Content and Time variable are preselected

The first value of the content and the time dimensions are preselected on the selection page. This behavior can be controlled by the *Settings* --> *Selection* --> *Select first value* setting in the administration tool.

The screenshot shows the PxWeb Administration interface. At the top, there is a blue header with "PxWEB ADMINISTRATION" on the left and "Log out English" on the right. Below the header is a navigation menu with "HOME", "SETTINGS", "TOOLS", "FEATURES", and "USERS". Under "SETTINGS", there are sub-menus: "GENERAL", "MENU", "SELECTION", "PRESENTATION", and "NAVIGATION". The "SELECTION" sub-menu is active, and a "Save" button is visible in the top right corner of the settings area.

The main content area is titled "SELECTION" and contains a list of settings with their current values and help icons:

Show mandatory mark	Yes
Allow aggregations	Yes
Show hierarchies	Yes
Hierarchical levels open	1
Show marking tips	Yes
Search button mode	Many values
Max rows without search	600
Show time without search	Yes
List size	6
Show selection limits	Yes
Valueset must be selected	No
Show 'All available values'	Yes
Title from menu	No
Standard application header title	No
About tables as links	No
Selection from group	Yes
Buttons for content variable	No
Default search method	Free text search
Select first value	Yes

Bug fix: Illegal links in "Tree view without files"

Fixed bug where the "View table" link did not work when using "Tree view without files".

Bug fix: Some characters are not supported in search on selection page

Bug reported in the Google group. It is now possible to search for values containing characters: . (point), + (plus) and so on.

Caching and performance

Menu caching

A new cache is introduced that cache menu objects. Menu objects describe the structure of your database and are used in the tree view and the breadcrumb of PxWeb. Using the menu cache eliminates unnecessary calls to the database or access to the menu.xml file.

Improved performance in PxWeb

Menu objects are cached for 24 hours (by default).

To enable the cache add the following line into the web.config I the appSettings block:

```
<add key="CacheServiceExpirationInMinutes" value="1440"/>
```

The value *1440* represents the number of minutes menu objects will live in the cache. You can change this value if you like.

NOTE! If you have an environment where you want changes to appear directly, for example in an inner production environment, you would probably switch the menu cache off in PxWeb. You do this by removing the line above completely from web.config.

Improved performance in the API

Menu caching are done for 24 hours.

Often a time period is demanded before it is published which causes unnecessary database access. To avoid this the following improvements have been made:

- Check that the selection is valid before trying to get data.
- Calls for invalid selections are being cached.

Check that all mandatory variables has at least one value selected.

Clear PxWeb caches

In the administration tool under *Tools* --> *Reset* the "Clear saved query cache" function has been replaced with the new function "Clear caches":

Clicking “*Clear caches*” will clear all of the PxWeb caches, that is:

- The saved query cache
- The API cache
- The Menu cache

The “*Clear caches*” function is also called when you click the “*Reset all*” link or when you generate a database (*Tools --> Generate database*).

Files and file formats

Unique filenames

When saving as a file the filenames are now created with unique filenames. A timestamp is added to the filename, for example:

BE0101N1_20200129_103429.xlsx

The file above was created 29th of January 2020 at 10:34:29.

Setting for filename base

A setting has been added to the administration tool where you can specify the base for filenames for files created in PxWeb. It can be either matrix or tableid.

The new setting is called "Get filename from" and is found under *Settings --> File Formats* in the administration tool:

If tableid do not exist, matrix will be used by default.

JSON-stat 2.0

PxWeb and the PxWeb Api now has support for the JSON-stat 2.0 file format.

JSON-stat

More metadata

A new section with PX-related metadata has been added to the JSON-stat file format. The section is added at the end of the file and looks like this:

```
"extension": {
  "px": {
    "infofile": "NR0103",
    "tableid": "TAB4553",
    "decimals": 0
  }
}
```

infofile	Value of keyword INFOFILE
tableid	Value of keyword TABLEID
decimals	Value of keyword SHOWDECIMALS if it exist, else value of the keyword DECIMALS. This is the default number of decimals to

	be displayed in the table. Note that this value might be overridden by the decimals value that is declared in the unit section of the content variable if the table has more than one content.
--	--

The metadata is only added to the file if it exists for the table. This metadata is also present in the new file format JSON-stat2.

New internal json serialiser

Internally in the JSON-stat component we are now using a new json serialiser, *Newtonsoft.Json*.

Json

More metadata

A metadata section has been added to the end of the json file containing the following metadata:

```
"metadata": [
  {
    "infofile": "EN0105",
    "updated": "2020-02-13T15:20:00Z",
    "label": "Gross electricity supply, GWh by type of power plants and year",
    "source": "Swedish Energy Administration"
  }
]
```

The metadata is only added to the file if it exists for the table.

Remove BOM character

The BOM character is removed from the Json file format.

Excel

Removed background color in file cells

In earlier versions of PxWeb non numeric data cells in exported Excel files got a pink background color. In PxWeb 2020 v1 these cells are displayed without the background color.

Saved queries

Change language for saved queries

Change the language of a saved query by specifying the desired language in the querystring parameter *lang*.

The following url will display the output of the saved query with the id 123456 in Swedish:

<http://www.mypxweb.com/sq/123456?lang=sv>

For this to work, the PX database must of course support Swedish.

JSON-stat 2.0

The saved query switch for JSON-stat 2.0 is `json_stat2`.

Example:

http://www.mypxweb.com/sq/1111.json_stat2

Arrange saved query files in subdirectories

If saved queries are stored as files on the web server they are stored in the `/App_Data/Queries/` folder of your website. In PxWeb 2020 v1 it is possible to create subdirectories of this folder which makes it possible to arrange your saved query files in different folders if you want to.

Bug fix: Not possible to call saved queries for disabled databases

A bug in previous versions made it possible to call a saved query for a database that had been disabled in the administration tool. This problem has been fixed.

Bug fix: Content not always selected when using ?select from saved query

Using the `?select` switch for a saved query will redirect to the selection page and preselect the values that was selected when the saved query was created. A bug has been fixed so this works also when having the following conditions:

1. Redirect to the selection page is demanded for the saved query using the `?select` switch
2. The setting "Remove single content" is set to True
3. There is only one value selected for the content variable

Bug fix: Saved query URL on load balanced servers using https:

In earlier versions of PxWeb, when you created a saved query on a PxWeb installation that were using load balanced servers and https, the generated saved query URL started with http: instead of https:. This problem has been fixed.

Aggregation files

Arrange aggregation files in subdirectories

If you are using aggregation files they are stored in the */Resources/PX/Aggregations/* folder of your website. In the same way as mentioned above for saved query files, you can now create subdirectories of this folder and arrange your aggregation files in these folders.

Api

Separate settings for database availability in PxWeb and the PxWeb Api

In PxWeb it is possible to disable a database in the PxWeb user interface but still has it available through API calls.

Database availability in the PxWeb user interface is controlled on the *Settings* --> *General* --> *Databases* page in the administration tool:

Enabled	Db created	Index status	Action
<input checked="" type="checkbox"/>	Example	11/6/2019	9/6/2018 Create index
<input checked="" type="checkbox"/>	Greenland	1/15/2020	NotIndexed Create index
<input type="checkbox"/>	Switzerland	12/3/2019	NotIndexed Create index

Enabled	Index status	Action
<input checked="" type="checkbox"/>	ssd	NotIndexed Create index

Database availability in the PxWeb Api is controlled on the *Features* --> *API* --> *General* page in the administration tool:

PX databases	da	fi	kl	sv	en
Example	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Greenland	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Switzerland	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

CNMM databases	da	fi	kl	sv	en
ssd	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

It is only possible to set a database as available in the PxWeb Api if the database supports the specified language.

Information about MAP keyword in the API metadata response

If information about the MAP keyword exists, it will be added to the geographical dimension in the metadata response (HTTP GET) from the API:

```
...
"variables": [
  {
    "code": "region",
    "text": "region",
    "values": [
      "01",

```

```
        "03"  
      ],  
      "valueTexts": [  
        "01 Stockholm county",  
        "03 Uppsala county"  
      ],  
      "elimination": true,  
      "map": "Sweden_county"  
    },  
    ...
```

Path to table no longer case sensitive in the API

The part after the database name in the API-URL is no longer case sensitive in GET requests.

In older versions of the PxWeb API this URL would work:

<http://api.scb.se/OV0104/v1/doris/sv/ssd/START/BE/BE0101/>

But not this one:

<http://api.scb.se/OV0104/v1/doris/sv/ssd/START/BE/be0101/>

In PxWeb 2020 v1 both [URL:s](#) will work.

Other

User agent bug fix

Handle if user agent is not set in saved queries

IOS bug fix

In PxWeb 2019 rxid was removed from the URL and instead handled by a javascript. However the javascript did not work with IOS which made it impossible to work with a table in IOS (perform operations like pivot or save to different file formats). This bug has been fixed with the limitation that it is only possible to work with one table at a time on IOS devices.

Pivot bug fix

Fixed bug in the pivot operation which caused the content variable to not be correctly set.

Bug fix: Decimals disappears after pivot

Fixed bug where decimals disappeared when the table contained only rows and no columns.

Updated version of jQuery-UI

The jQuery-UI library has been updated to version 1.12.1.

New default encoder

The default encoder in PxWeb has been changed to the *System.Web.Security.AntiXss.AntiXssEncoder* which give a better protection against cross-site scripting (XSS) attacks and LDAP injection attacks.
